Information Sheet for Control Individuals:

National Prion Monitoring Cohort

(Note: this information sheet is for the third strata – asymptomatic individuals without confirmed disease)

Version: 1.0

Date: 20 April 2009

A longitudinal observational study of all patients diagnosed with or at high risk of developing human prion disease

You are being invited to take part in a research study. Before you decide it is important for you to understand why the research is being done and what it will involve. This information sheet explains the whole study. It may help you decide first whether you wish to take part at all, and, if you do want to take part, how much follow-up you would be comfortable with. This will depend on your feelings about the different types of follow-up assessments. Please take time to read the following information carefully, and discuss it with others if you wish. Ask us if there is anything that is not clear, or if you would like more information. Take time to decide whether or not you wish to take part.

What is the purpose of the study?
The purpose of this study is to collect information about prion disease. No treatment will be given as part of this study. By closely documenting how prion disease may develop, we hope to be in a better position to determine the effects of any future drugs and understand more about prion disease.

Why have I been chosen?
You are being invited to take part in this study as a research subject for a Control group (control subject) because you do not have prion disease.

Do I have to take part?
It is entirely up to you to decide whether to take part or not. If you do decide to take part you will be given this information sheet to keep and be asked to sign a consent form. Even after you have decided to take part, you are free to withdraw at any time without giving a reason. A decision to withdraw, or a decision not to take part, will not affect the standard of care you receive.

What will happen to me if I take part?
You will have clinical assessments every at least every 12 months and at most every 6 months – it would be up to you how often you would be willing to be seen. If you live a long way from London and would prefer to be seen locally, we will arrange for the study staff from the National Prion Clinic to visit you at home for follow-up visits. Otherwise, you will be seen at the National Prion Clinic in London. If you decide to have the follow-up visits in London, the travel costs for you and up to two relatives (including the cost of transport, overnight stay in a shared room at a hotel close to the National Prion Clinic and necessary food) will be paid for by the study.

What tests and examinations are required?

- Neurological examination
  You will undergo a clinical neurological examination to see how you are doing clinically. This examination will be repeated at each follow-up visit.

- Level 1: Standard neurological assessments
  There are a number of more detailed neurological assessments that we would also like to carry out as
part of this study. Some of the tests may be familiar to you and involve asking you to carry out paper and pencil tests measuring intellectual functioning, memory functioning, attention/concentration, language abilities, reasoning and problem solving. **We appreciate not everybody will want to have all the different assessments and you will be free to refuse any test you do not want.** A study doctor will explain the assessments to you.

- **Level 2: Optimal assessments**
  - **Visual recording of neurological examination**
    We would like to visually record the neurological examination. This will enable your progress to be reviewed by doctors who are not involved with your care so that they can assess objectively how the disease may develop. A unique study number and date of birth, but not your name, would be used to identify the visual recordings that would be kept securely like your hospital notes. Due to some of the tests that are part of the neurological examination, such as eye tests, we are not able to hide your face in the visual recording so it will be visible. **We appreciate not everybody will want to have visual recordings taken during the neurological examination and you will be free to refuse the visual recording.** A study doctor will explain the neurological examination to you.
  
  - **MRI scan, EEG, EMG and NC**
    We would like to do some special tests that will help to better understand prion disease. These include an MRI brain scan, an electroencephalogram (EEG), an electromyography (EMG) and nerve conduction (NC). **We appreciate not everybody will want to have all the different tests and you will be free to refuse any test you do not want.** Separate information sheets are available about the MRI scan, EEG, EMG and NC.

  - **Blood samples**
    A 50ml blood sample, equivalent to 8 teaspoons, will be taken – some will be used immediately for blood tests and some will be stored. New tests to look for progression and diagnosis of prion disease are being developed and storing these samples will enable these tests to be done later during the study or after the study to help research into prion disease. **We appreciate not everybody will want to have a blood sample taken and you will be free to refuse the blood test.**

    We will discuss with you at each visit which of these assessments you would feel comfortable with and you would be able to manage.

**What are the possible disadvantages and risks of taking part?**
As no drugs are prescribed as part of this study, the only potential risks are those associated with investigations, which are minimal. You will have a number of additional tests and at least an annual hospital or home visit.

**What are the potential benefits of taking part?**
The information we get from this study may help us to treat future patients with prion disease better.

**Is there anything else that I may be asked to do?**
You may be asked to give blood for DNA tests to other research studies of human prion disease. Rather than repeating these tests we are asking if you would agree to any genetic information from these tests (such as mutations in different genes) being linked to this study, in order to investigate and better understand how different people might respond to treatment. This linking would only be done anonymously through your study number, so you would not get any results from these extra analyses.

**Will my taking part in this study be kept confidential?**
The study will be conducted in compliance with the Data Protection Act, 1998. All information that is collected about you during the course of the study will be kept strictly confidential but it will not be completely anonymous. All information about you, including samples will be stored only by a study number, your date of birth and initials, and not by your name. **Names will not be used in any of the study records or samples.** When you consent to take part in this study you also agree to allow
authorised staff from the MRC Prion and Clinical Trials Units to inspect your medical records to monitor the study. In no circumstances will your name or address be disclosed outside the clinic. We would like you to let us tell your GP and any other doctor looking after you that you have entered this study. Any blood and other samples taken from you in the course of this study may be used for further research in this area. By signing the consent form you are authorising the use of these tissues or body fluids for these future tests.

What will happen to the results of the study?
We will regularly review data from the study and publish results in peer reviewed journals. A summary of any published results will be provided for you if you wish. You will not be identified in any report or publication on this study.

Who is organising and funding the research?
The MRC Prion and Clinical Trials Units are organising the National Prion Monitoring Cohort. The Department of Health is funding the study. The doctors looking after you will not receive any additional payments if you enter the study. Your hospital will be reimbursed for any extra tests done as part of the study.

Who has reviewed the study?
The study has been reviewed by the Scotland A Multi-centre Research Ethics Committee.

Contact for further information
Please address any further questions to Simon Mead, Consultant Neurologist and Clinical Co-ordinator; or Professor John Collinge, Clinical Director, at the National Prion Clinic:

National Prion Clinic
National Hospital for Neurology and Neurosurgery,
Box 98
Queen Square
London WC1N 3BG
